

Spinach.io unveils AI Voice Commands for Jira and Trello

May 10, 2024

Spinach.io, a developer of AI project management tools, has announced AI voice command integrations for Jira and Trello at the Atlassian Team '24 conference. Spinach is an AI virtual assistant that can automate project management tasks and update project boards in Jira and Trello based on voice commands during meetings.

Spinach alleviates the headache of manually taking notes during team or project meetings or sifting through meeting recordings to create summaries, deliver action items, or follow up with individuals. Teams benefit from a reliable agile assistant that is always on time, never misses a meeting, has no human bias, and captures essential meeting details and follow-ups with incredible accuracy.

"Artificial intelligence is becoming more ingrained in the workplace but the capabilities go beyond that of a simple tool – AI is helping workers be better versions of themselves," said Matan Talmi, CEO of Spinach.io. "There's been a natural inclination to humanize intelligent things and make them more personable. It's the next step in the progression of human/AI interaction."

Spinach integrates with existing meeting calendars, video conferencing platforms, messaging tools, ticketing systems, and collaboration tools.

"Spinach connects the dots between team meetings and the Jira project board, and leaves no task forgotten," said Ron Levy, Chief Product Officer at Bono and former product leader at Atlassian. "The new voice commands make it easier than ever to add tickets to Jira or Trello and save much work after the meeting is over."
