

Unlocking Latin America's Wind Energy Potential: A New Project

November 4, 2024

Latin America, blessed with abundant wind resources, is poised to become a global leader in renewable energy. However, realizing this potential requires a comprehensive approach to address the challenges and opportunities that lie ahead.

A new project aims to guide policymakers and stakeholders across the region, offering insights and strategies rooted in local experiences and best practices. By overcoming barriers and fostering collaboration, Latin American countries can accelerate their transition to a sustainable energy future.

Key recommendations of the project include streamlining permitting processes, prioritizing public interest and equitable benefit-sharing, and building trust through early and continuous engagement with local communities. By focusing on these areas, Latin American governments can create an enabling environment for wind energy development, attracting investment, and driving economic growth.
