

USDOT Invests \$2.4 Billion to Modernize America's Rail Infrastructure

November 1, 2024

The U.S. Department of Transportation's (USDOT) Federal Railroad Administration (FRA) has announced a significant investment of over \$2.4 billion in 122 rail improvement projects across 41 states and Washington, D.C. This substantial funding, allocated through the Bipartisan Infrastructure Law, aims to revitalize the nation's rail network, enhance safety, and stimulate economic growth.

The CRISI (Consolidated Rail Infrastructure and Safety Improvements) Program will fund a diverse range of projects, including track upgrades, bridge rehabilitations, and improvements to port rail connections. By prioritizing investments in critical infrastructure, the FRA seeks to enhance the efficiency and reliability of rail transportation, reduce congestion on highways, and reduce greenhouse gas emissions.

A key focus of the program is to support smaller, short-line railroads, which play a vital role in regional economies and supply chains. By investing in these essential rail lines, the FRA aims to strengthen local communities and promote economic development.

This significant investment in rail infrastructure is part of the Biden-Harris Administration's broader vision for a modern, sustainable transportation system. By modernizing the nation's rail network, the administration aims to create jobs, boost economic competitiveness, and improve the quality of life for Americans.
